302 Women clip the hair in a bang across the forehead and let it grow down the back, although here, too, it may be bobbed. A few girls cut the hair in European male fashion ("boyish bob"), but this is exceptional. Many of the men now cut their hair short all around in the commonest European style, but others have a bang on the forehead and a bob around the back. In both sexes the hair usually is left free, without braiding or other special doing up, and [301] generally unparted. It is not native custom to wear anything in the way of ornament or headgear in or on the hair, except for special occasions like dances.

142 There is some tendency toward abdominal protrusion, so common everywhere among starch-eating and often parasitized tropical peoples, but it is seldom pronounced and often practically absent. Some children and adults of both sexes have slender and graceful figures even in this respect and practically 141 all are otherwise beautifully built. The average height of the men is 160 centimeters (5 feet 3 inches) and of the women 147 centimeters (4 feet 10 inches), while the average male weight is about 56 kilos (124 pounds) and female weight about 47 kilos (104 pounds). The tallest Kamarakoto seen, a man of course, measured 168 1/2 centimeters (5 feet 6 inches) and the heaviest, also a man but not quite so tall, weighed about 63 kilos (140 pounds), although one man of the same stock but from outside the central group weighed about 70 kilos 142 (155 pounds). These Indians are thus small, by our standards, although they are not pygmies and are indeed rather large as Guayana Caribs go, as will be shown below. No definite obesity was seen, and striking thinness is almost equally rare.

[291] The feet, never in shoes and seldom in sandals, naturally tend to be broad and the toes, particularly the great toe, are divergent and mobile (Fig. 93). [516] They are used as extra fingers for many kinds of work, such as holding cloth when sewing or to pick up or pass along small objects without bothering to bend over.

304 Aside from tattooing and ear-piercing, mentioned on a previous page, 184 intentional mutilation or deformation is not practiced and even these relatively mild mutilations are indulged in only by a minority of the tribe. Unintentional ●732 deformities are likewise unusual although I do not believe that deformed infants [847] are killed (information on this ticklish point is not reliable, but the fact that a few individuals are deformed suggests that the native claim is true). Out of 64 Kamarakotos definitely recorded in detail and about that many more examined more casually, one young adult had one short leg, apparently from an early fracture, another had the right external ear congenitally absent, a child (brother of the congenitally deformed young man just mentioned) had a deformity of the sternum, probably congenital, and another child had the eyes slightly crossed. These were all males and no deformed females were seen. Intellectual deformities, either lesions or intelligence below the normal range, are quite lacking as far as was observed. There are no mentally pathological or psychotic individuals
